

Q: Given N input strings & Q queries. for each query check if given query is prefix of any given input string.

Note :- length of every string $\leq l$.

Substring starts at index = 0.
(complete string is also a prefix.)

<u>Input strings (N)</u>	<u>Queries (Q)</u>	Yes / No
anaconda	anaco	✓
dress	fry	✗
eaten	roade	✓
friends	algor	✓
roadies	sour	✗
anaco	dress	✓
algorithms		
sound		

Idea :-

- 1) Insert all the words in a Trie.
- 2) for every query word, iterate over the trie from root & check query is Prefix or not.

$$TC : O(N \times l + Q \times l)$$

$$SC : O(Nl)$$

* Using Trie DS, searching prefix is most optimal.

\Rightarrow Trie \equiv Prefix
Tree.

Q. Given a binary matrix $mat[N][M]$, find the no. of distinct rows.

	0	1	2	3	4	
0	1	0	0	1	0	X
1	1	1	0	1	1	X
2	0	1	0	1	0	✓
3	1	1	0	1	1	✓
4	1	1	0	0	1	✓
5	1	0	0	1	0	✓
6	0	0	1	1	0	✓

$mat[7][5]$

ans = 5

Every row, consider only its one occurrence

Idea 1 :-

For every row, compare it with the rows below it, If $freq. == 0$, count++.

TC:

$O(N^2 \cdot M)$

SC: $O(1)$

$$\begin{array}{l}
 0 \Rightarrow N-1 \\
 1 \Rightarrow N-2 \\
 2 \Rightarrow N-3 \\
 \vdots \\
 \textcircled{1}
 \end{array}
 \left.
 \begin{array}{l}
 \\
 \\
 \\
 \\
 \end{array}
 \right\} \approx O(N^2)$$

Idea 2 :-

Convert each row into string & insert into HashSet.

TC : $\underbrace{N \times M}_{\substack{\uparrow \\ \text{Converting each} \\ \text{row into} \\ \text{string.}}} + \underbrace{N \times M}_{\substack{\uparrow \\ \text{insert } \textcircled{N} \text{ strings} \\ \text{of length } M \text{ into} \\ \text{HashSet.}}}$

SC : $O(MN)$

Idea 3 :-

	0	1	2	3	4
0	1	0	0	1	0
1	1	1	0	1	1
2	0	1	0	1	0
3	1	1	0	1	1
4	1	1	0	0	1
5	1	0	0	1	0
6	0	0	1	1	0

Decimal

18

27

10

27

25

18

6

$\Rightarrow \underline{5}$

* For every row, convert it into decimal & insert into the HashSet.

TC : $\underbrace{N \times M}_{\substack{\text{Convert every} \\ \text{row to a} \\ \text{decimal no.}}} + \underbrace{N}_{\substack{\text{insert } N \text{ int's} \\ \text{into } \underline{\text{Set.}}}}$

: $O(N \cdot M)$

SC : $O(N)$

↳ Hashset of N integers.

Issues

$M \leq 31 \Rightarrow \text{int}$

$M \leq 63 \Rightarrow \text{long}$

$M > 63$

$M = 200 ?$

* For larger values of M , this approach won't work.

Idea 4 :-

* Insert every row in a Trie.

* Class Node { // Binary Trie

Node c[2]; data < $\begin{matrix} 0 \\ 1 \end{matrix}$

Node() {

 c[0] = Null;

 c[1] = Null;

}

}

Trie Creation

* While inserting a row in Trie, if we are not creating even a single new node, it means entire row was already present in the Trie.

Code :-

```
int uniqueRows (int mat[][ ], N, M) {  
    count = 0  
    Node root = new Node();  
    for (i = 0; i < N; i++) {  
        // Insert mat[i]  
        if (insert (root, mat[i], M))  
            count++  
    }  
    return count;  
}
```

will return True
if we have
created even
a single node
while inserting
mat[i].

```
bool insert (root, arr[], M) {  
    bool flag = false;  
    for (i = 0; i < M; i++) {  
        e = arr[i];  
        if (root->C[e] == Null) {  
            // create a new Node  
            root->C[e] = new Node();  
            flag = true;  
            root = root->C[e];  
        }  
        else {  
            root = root->C[e];  
        }  
    }  
    return flag;  
}
```

$$TC : O(N \times M)$$

$$SC : O(N \cdot M) \quad [\text{Worst Case}]$$

Q. Given an Array of size N, find the pair with max XOR value.

$\Rightarrow i, j$ s.t $arr[i] \wedge arr[j]$ is MAX, $i \neq j$

N=4

	0	1	2	3
	4	3	2	7

$$A[0] \wedge A[1] = 7$$

$$A[0] \wedge A[2] = 6$$

$$A[0] \wedge A[3] = 3 \quad \Rightarrow \text{ans} = \underline{\underline{7}}$$

$$A[1] \wedge A[2] = 1$$

$$A[1] \wedge A[3] = 4$$

$$A[2] \wedge A[3] = \underline{\underline{5}}$$

Hint

A B
1 0 0 0 0 vs 0 1 1 1 1

A > B.

N = 9

0	1	2	3	4	5	6	7	8
22	61	38	27	21	34	42	37	43

	32	16	8	4	2	1
22 :	0	1	0	1	1	0
61 :	1	1	1	1	0	1
38 :	1	0	0	1	1	0
27 :	0	1	1	0	1	1
21 :	0	1	0	1	0	1
34 :	1	0	0	0	1	0
42 :	1	0	1	0	1	0
37 :	1	0	0	1	0	1
43 :	1	0	1	0	1	1

↓

A = 22 : 0 1 0 1 1 0
 B = — : 1 0 1 0 1 1

A ^ B : 1 1 1 1 0 1

max value of A ^ B with
A = 22.

⇒ Repeat the above process for every value of A in the Array & maintain max.

TC : $O(N * (N * 31))$

* Trie Approach

⇒ for all the no's, insert the same number of bits in the Trie.

⇒ find the max element in Array and find the no. of bits in this element.

```

class Node {
    Node c[2];
    Node() {
        c[0] = Null;
        c[1] = Null;
    }
}

```

3

```

int maxXOR ( arr[], N) {
    int me = max(arr);  $\Rightarrow$   $O(N)$ 
    int b = maxSetBits(me);
    Node root = new Node();
    for (i = 0; i < N; i++) {
        insert ( root, arr[i], b);
    }
    ans = 0;
    // find element A[i] & get max XOR.
    for ( i = 0; i < N; i++) {
        ans = max (ans, query (root, A[i], b));
    }
    return ans;
}

```

3

```

void insert (root, ele, b) {
    for (i = b; i >= 0; i--) {
        // ith bit in ele.
        int e = checkBit (ele, i);
        if (root.c[e] == Null) {
            root.c[e] = new Node();
            root = root.c[e];
        }
        else {
            root = root.c[e];
        }
    }
}

```

3

```

int query (root, ele, b) {
    ans = 0
    for (i = b; i >= 0; i--) {
        // ith bit in ele.
        int e = checkBit (ele, i);

```

ans = 0

```

        for (i = b; i >= 0; i--) {

```

// ith bit in ele.

```

        int e = checkBit (ele, i);

```

// If $e \rightarrow 0 \Rightarrow$ we need 1
 // If $e \rightarrow 1 \Rightarrow$ we need 0

1-e

```

        if (root.c[1-e] != Null) {

```

// We can set ith bit in ans.

```

            ans = ans + (1 << i)

```

```

            root = root.c[1-e];
        }
        else {
            root = root.c[e];
        }
    }
}

```

3

else {

```

            root = root.c[e];
        }
    }
}

```

3

3

```

    return ans;
}

```
